Reliability

In excess of 5000 STABLOCK 4032 radio test sets are currently in use worldwide. This success has been due to the versatile design, simple operation and wide variety of system tests which can be made with the "universal" test set.

Applications range from high-speed production tests and quality measurements to servicing and commissioning tests. The wide variety of hardware modules and software options covering frequency ranges up to 2.3 GHz, provide comprehensive capability of analog and digital cellular, cordless and two-way radio systems.

Additional capability includes base station measurements and paging tests.

Systems include TETRA Digital Trunked Radio, Tetrapol as well as CDMA base station testing at 800 MHz and 1900 MHz. The GSM Option of the STABLOCK 4032 now is also capable of testing dual-band mobiles.

Please refer to individual data sheets for further details of system performance.

Typical performance is derived from the standard deviation of many hundreds of production units operating under normal environmental conditions of 20°C.
